Condensed matter physics is the field of physics that deals with the macroscopic and microscopic physical properties of matter. In particular it is concerned with the "condensed" phases that appear whenever the number of constituents in a system is extremely large and the interactions between the constituents are strong.

Hardness is a measure of the resistance to localized plastic deformation induced by either mechanical indentation or abrasion. Some materials (e.g. metals) are harder than others (e.g. plastics, wood). Macroscopic hardness is generally characterized by strong intermolecular bonds, but the behavior of solid materials under force is complex; therefore, there are different measurements of hardness ...

Superconductivity If mercury is cooled below 4.1 K, it loses all electric resistance. This discovery of superconductivity by H. Kammerlingh Onnes in 1911 was followed by the observation of other metals which exhibit zero resistivity below a certain critical temperature. The fact that the resistance is zero has been demonstrated by sustaining currents in superconducting lead rings for many years ...

Graphitic carbon nitride (gâ€•C 3 N 4)â€•coated nickel foam is demonstrated to be highly effective for promoting uniform lithium deposition. The unique microâ€•electric field at the triâ€•sâ€•triazine units of gâ€•C 3 N 4 induces numerous Li nuclei at initial nucleation stage and, subsequently, these Li nuclei guide wellâ€•distributed Li plating on 3D Ni foam.
